Abstract (Basic): JP 62061065 A
The positively chargeable magnetic developer includes at least the magnetic toner, the positively chargeable silicic acid fine powder, and strontium oxide powder.
The mixt. ratio of the positively chargeable silicic acid fine powder to 100 wt.% of magnetic toner, is 0.01-20 wt.%, and that of oxide is 0.1-20 wt.%. The ave. particle dia. of the oxide is 0.01-5 micron, and that of magnetic toner is 5-30 micron. The silicic acid fine powder is silicon dioxide anhydride (silica), aluminium silicate, sodium silicate, potassium silicate, magnesium silicate, etc. can be used. The surface of the silicic acid fine powder is treated by silicone oil having an amine at side chain, or the amino silane to be denatured to the positively chargeable.

USE/ADVANTAGE - The magnetic developer having the uniform positively chargeable property, can be obtd. The attachment of the toner to the background area at the development, the fogging, and the scattering of the toner to the peripheral edge of the latent image, can be remarkably prevented, and the image of high density, partic., the halftone image of high quality can be reproduced.

Abstract

X-ray photog. polyester film supports are dyed by using 1,4-bis(3-cyclohexylsulfamoyl-2,4,6-trimethylphenylamino)anthraquinone (I) and II (R, R₁ = lower alkyl, lower alkoxy; n ≥ 1; m ≥ 1). Thus, 100 parts of poly(ethylene terephthalate) prep'd. from di-Me terephthalate and ethylene glycol was mixed with I 0.04 and 1,4-bis(p-toluidino)-5,8-dihydroxyanthraquinone 0.005 parts, and the mixt. was formed into a film which was useful as a support for x-ray photog. film.
